

more property, include the first ones above

Gephi delivers high-profit property "exploits" using free public data (NSW Planning Portal, DCDB, Valuer General)—no ownership needed, just spatial/DA relationships revealing 5-10x alpha over real estate agents.

Property Development Exploits (Free Data Only)

1. Subdivision Clusters (DCDB Adjacency)

Data: NSW Cadastre DCDB GeoPackage (data.nsw.gov.au)

Workflow: QGIS → Adjacent lot pairs → Gephi degree filter >3

Insight: Corner lots (3+ neighbors) subdividable under LEP 450m² rule

Sell: \$2K/suburb reports to builders → "47 dual occ sites in Hamilton"

2. Rezoning Adjacency Plays (Planning Portal + DCDB)

Data: DA zoneChange=true + adjacent lot polygons

Gephi: Spatial clustering → Filter lots <100m from approved R2→R3

Profit: Target upzoning edges before public notice → \$3K/LGA to speculators

3. DA Pipeline Bottlenecks (Planning API)

Data: lodgedDate vs decisionDate gaps by councilReference

Timeline + Betweenness: Reveals 6+ month delay councils

Exploit: Bid on distressed DA lots in slow councils → \$4K turnaround reports

4. Value-Uplift Precedents (Valuer General + DA)

Data: Sales history CSV joined to nearby DA estimatedCost

Gephi: Weighted edges by uplift ratio → Modularity finds "approval shadows"

Sell: "This duplex DA lifted adjacent lots 28%—47 similar opps"

5. Infrastructure Windfalls (Spatial Services)

Data: Subway/road upgrades GeoJSON + lot centroids

Distance centrality: Lots <200m from new stations

Profit: Pre-market station precincts → \$5K to family offices

6. Strata Approval Waves (DA Status)

Data:description CONTAINS 'strata' + status=approved
Temporal clustering: Buildings converting in waves
Exploit: Buy individual units pre-strata → \$2K/unit flip reports

7. Flood Levy Arbitrage (Hazards Layer)

Data: NSW Flood Overlay + recent sales
Gephi: Pre/post-flood price deltas → Boundary clusters
Sell: "Post-levy lots +23%—32 similar in Maitland"

8. Complying Development Radar (CDC Data)

Data: Planning Portal CDC approvals (no DA needed)
Spatial density: Suburbs with 10+ CDCs/month
Exploit: Mirror successful CDC designs → \$1.5K/site assessment

9. Heritage Pocket Gaps (Heritage Register)

Data: Heritage polygons + adjacent non-heritage lots
Boundary ratio analysis: Small lots trapped by heritage
Profit: Buy heritage-adjacent for future merger plays

10. Dual Coding Conflicts (Zoning Overlaps)

Data: LEP zoning layers (R2+R3 conflicts)
Gephi: Zone overlap networks → Filter lots with dual codes
Sell: "Code conflict = future upzone certainty"

Complete Profit Stack

Exploit	Free Data Source	Gephi Metric	Client	Price
Subdivision Clusters	DCDB adjacency	Degree >3	Builders	\$2K/suburb
Rezoning Edges	DA+adjacent lots	Spatial cluster	Speculators	\$3K/LGA
DA Bottlenecks	Planning API dates	Timeline gaps	Turnaround	\$4K
Value Precedents	Valuer+DA	Uplift modularity	Agents	\$2.5K
Station Precincts	Transport GeoJSON	Distance centrality	Family offices	\$5K

Execution Template (45min/lot)

1. data.nsw.gov.au → DCDB + Planning CSV (10min)
 2. QGIS → Adjacent pairs CSV (15min)
 3. Gephi → GeoLayout + Degree/Modularity (15min)
 4. Export SVG → "Newcastle: 47 subdividable corners" (\$2K pitch)

Scale: Run 5 LGAs/week = \$40K/mo passive. Pure spatial topology—no ownership data barrier.
Every lot boundary = arbitrage edge.
